| Grade                 | <b>11.00</b> out of 11.00 ( <b>100</b> %)                         |
| Question 1 Correct    |   |
| Mark 1.00 out of 1.00 |   |
|                       | typically made up of what components?                             |
| a. None of th         | e options provided represent what a has function is comprised of. |
| b. Security ke        | <sub>s</sub> y  |
| c. Hash code          |   |
| d. Hash lette         | r   |
| e. Normal dis         | stribution function   |
| f. Hash num           | ber   |
| g. Compress           | ion Function 🗸  |
|                       |   |
|                       |   |
| Your answer is corr   |   |
| The correct answer    | rs are: Hash code, Compression Function                           |
|                       |   |
| Question 2            |   |
| Correct               |   |
| Mark 1.00 out of 1.00 |   |
|                       |   |
| A larger load factor  | α = n/m will result in faster insertion, deletion and searching.  |
| 🌑 a. False 🗸          |   |
| ob. True              |   |
|                       |   |
|                       |   |
| Your answer is corr   |   |
| The correct answer    | ris: False  |

| Question 3  |
|---|
| Correct   |
| Mark 1.00 out of 1.00   |
|   |
| Assuming that the hash values are like random numbers, it can be shown that the expected number of probes for an insertion with open addressing is 1/(1-a).   |
| ■ a. True ✓   |
| ○ b. False  |
|   |
| Your answer is correct.   |
| The correct answer is: True   |
|   |
| Question 4  |
| Correct   |
| Mark 1.00 out of 1.00   |
|   |
| The complexity of insertion, deletion and searching using open addressing is $(1+\alpha)$ .   |
|   |
| o a. True   |
| <ul><li>a. True</li><li>b. False ✓</li></ul>  |
|   |
| b. False   ✓  |
| <ul><li></li></ul>  |
| b. False   ✓  |
| <ul><li></li></ul>  |
| <ul> <li>▶ False ✓</li> <li>Your answer is correct.</li> <li>The correct answer is: False</li> <li>Question 5</li> </ul>  |
| ● b. False ✓  Your answer is correct.  The correct answer is: False  Question 5  Correct  |
| <ul> <li>▶ False ✓</li> <li>Your answer is correct.</li> <li>The correct answer is: False</li> <li>Question 5</li> </ul>  |
| ● b. False ✓  Your answer is correct.  The correct answer is: False  Question 5  Correct  Mark 1.00 out of 1.00   |
| ● b. False ✓  Your answer is correct.  The correct answer is: False  Question 5  Correct  |
| ● b. False ✓  Your answer is correct.  The correct answer is: False  Question 5  Correct  Mark 1.00 out of 1.00   |
| ● b. False ✓  Your answer is correct.  The correct answer is: False  Question 5  Correct  Mark 1.00 out of 1.00  The complexity of insertion, deletion and searching using chaining method is (1+α).  |
| ● b. False ✓  Your answer is correct.  The correct answer is: False  Question 5  Correct  Mark 1.00 out of 1.00  The complexity of insertion, deletion and searching using chaining method is (1+α).  ● a. True ✓   |
| <ul> <li>■ b. False ✓</li> <li>Your answer is correct.</li> <li>The correct answer is: False</li> <li>Question 5</li> <li>Correct</li> <li>Mark 1.00 out of 1.00</li> <li>The complexity of insertion, deletion and searching using chaining method is (1+a).</li> <li>■ a. True ✓</li> <li>■ b. False</li> </ul> |
| ● b. False ✓  Your answer is correct.  The correct answer is: False  Question 5  Correct  Mark 1.00 out of 1.00  The complexity of insertion, deletion and searching using chaining method is (1+α).  ● a. True ✓   |

| Question 6            |  |
|-----------------------|--|
| Correct               |  |
| Mark 1.00 out of 1.00 |  |

Given a Hash function h(k) = k mod m where m = 7, which of the following values will collide with the value 5281

- a. 9679
- b. 1462
- c. None of the options provided collide.
- d. 6162
- e. 1989
- ✓ f. 1333 ✓
- ☑ g. 4322 ✓

Your answer is correct.

The correct answers are: 1333, 4322

| Question 7            |  |
|-----------------------|--|
| Correct               |  |
| Mark 1.00 out of 1.00 |  |

A hash table of length 10 uses open addressing with hash function  $h(k)=k \mod 10$ , and linear probing. After inserting 6 values into an empty hash table, the table is as shown below

Identify which of the following possible sequence of keys could have lead to this Hash table.

- a. 14, 39, 18, 13, 11, 27
- b. 27, 18, 11, 14, 39, 13
- $\hfill \square$  c. None of the options provided would result in the provided hash table.
- ☑ d. 27, 18, 39, 14, 11, 13 
  ✓
- e. 39, 18, 27, 13, 14, 11

Your answer is correct.

The correct answer is: 27, 18, 39, 14, 11, 13

Question 8

Correct

Mark 1.00 out of 1.00

The keys 12, 18, 13, 2, 3, 23, 5 and 15 are inserted into an initially empty hash table of length 10 using closed addressing with hash function  $h(k) = k \mod 10$  and chaining. What is the resultant hash table?

| 0 |             |
|---|-------------|
| 1 |             |
| 2 | 12, 2       |
| 3 | 13, 3<br>23 |
| 4 |             |
| 5 | 5, 15       |
| 6 |             |
| 7 |             |
| 8 | 18          |
| 9 |             |

b. None of the options provided represent the hash table that would result.

|    | 0 |
|----|---|
|    | 1 |
| 12 | 2 |
| 13 | 3 |
|    | 4 |
| 5  | 5 |
| П  | 6 |
| П  | 7 |
| 18 | 8 |
|    | 9 |

\_\_ e.

| 0 |    |
|---|----|
| 1 |    |
| 2 | 2  |
| 3 | 23 |
| 4 |    |
| 5 | 15 |
| 6 |    |
| 7 |    |
| 8 | 18 |
| 9 |    |

Your answer is correct.

The correct answer is:

| 0 |              |
|---|--------------|
| 1 |              |
| 2 | 12, 2        |
| 3 | 13, 3,<br>23 |
| 4 |              |
| 5 | 5, 15        |
| 6 |              |
| 7 |              |
| 8 | 18           |
| 9 |              |

A hash table of length 10 using open addressing with hash function  $h(k)=k \mod 10$ , and linear probing has been created.

| Ċ, |   |     |
|----|---|-----|
|    | 0 | - 2 |
|    | 1 |     |
|    | 2 | 32  |
|    | 3 | 73  |
|    | 4 | 12  |
|    | 5 | 15  |
|    | 6 | 82  |
|    | 7 | 37  |
|    | 8 | 65  |
|    | 9 | 9   |

Now the item 12 needs to be deleted using "Lazy Deletion". What is the resultant hash table?

C. None of the options provided represent the hash table that would result.

Your answer is correct.

The correct answer is:

| 0 |     |
|---|-----|
| 1 | 5   |
| 2 | 32  |
| 3 | 73  |
| 4 | DEL |
| 5 | 15  |
| 6 | 82  |
| 7 | 37  |
| 8 | 65  |
| 9 | 9   |

| Question 10           |  |
|-----------------------|--|
| Correct               |  |
| Mark 1.00 out of 1.00 |  |

Which of the following problems are known as being in the class P types of problems?

| a.   | Hamiltonian Cycle Problem                                   |
|------|---|
| b.   | Shortest path problem                                       |
| _ c. | Traveling Salesman Problem                                  |
| d.   | 0-1 Knapsack Problem  |
| ✓ e. | Depth-First and Breadth-First graph traversing $\checkmark$ |
| f.   | None of the options provided represent an P type problem    |
| ☑ g. | Test whether a graph is acyclic ✓                           |
| ✓ h. | Integer Addition and Multiplication problem $\checkmark$    |
| i.   | Graph Coloring Problem                                      |
| ✓ j. | Searching and sorting 🗸                                     |

## Your answer is correct.

k. The Subset-Sum Problem

The correct answers are: Searching and sorting, Depth-First and Breadth-First graph traversing, Test whether a graph is acyclic, Integer Addition and Multiplication problem

|                        | ·  |
|------------------------|--|
| Question 1             | l1   |
| Correct                |  |
| Mark 1.00              | out of 1.00  |
|                        |  |
| Which                  | of the following statements are true?  |
| _ a.                   | Class P is not a subset of NP  |
| <ul><li>□ b.</li></ul> | Class P is the complexity class of decision problems that can be verified in polynomial time, yet they can be solved in polynomial time on a non-deterministic sequential Turing Machine.                          |
| _ c.                   | None of the options provided (apart from this one) are true.   |
| _ d.                   | Class NP is the complexity class of decision problems that can be verified in polynomial time, yet they can be solved in polynomial time on a non-deterministic sequential Turing Machine.                         |
| _ e.                   | Class NP is the complexity class of decision problems that can be solved in $f(x)$ , where $f(x)$ is polynomial, on a deterministic sequential Turing Machine  |
| ✓ f.                   | Class P is the complexity class of decision problems that $\checkmark$ can be solved in $f(x)$ , where $f(x)$ is polynomial, on a deterministic sequential Turing Machine  |
| g.                     | It is well known that P=NP   |
| ✓ h.                   | It is unknown whether P=NP ✓   |
| ✓ i.                   | Class P is a subset of NP ✓  |
| Your ar                | nswer is correct.  |
| can be                 | rrect answers are: Class P is the complexity class of decision problems that solved in f(x), where f(x) is polynomial, on a deterministic sequential Turing Machine, Class P is a subset of NP, known whether P=NP |
